PermissionError [Errno 13] Permission denied Python 2023

Brett Dinzai   **Jan 2023**

To whom it may concern,

Please read what I have to say before giving the usual response to this question. I have asked on multiple Discords after googling for Hours. I am to the point that i am writing on a Python forum to figure out what the issue could actually be. The screen shots linked will show that not only am I Admin on my PC, I also have enabled "Full Control" on the hard drive that the files are in. I have enabled every permission known to me. The files i am trying to read from the drive are indeed there, and the file location indeed does exist. I have no other editor open with those files, no excel, or Tiled program open. I have even ran Pycharm as Admin and get the same error. I have even gone as far as trying to open the files from my D: drive instead of my G: drive. I get the same error. All i am trying to accomplish is to open a ".tmx" from an export from Tiled to use what I made as a map in a pygame. I can send any and all Code relating to this in case my coding is the issue.

I also restarted the Computer multiple times in case the files did not close properly in Tiled.

As a new user, I can only upload one screenshot, I have several I need to share, so i am sharing the one that shows i am indeed an Admin so that can be cleared up that I have significant permissions

I appreciate you (anyone) taking the time to help me with this, especially near the holidays
